|                               |                         |                                                   |                                             |
|-------------------------------|-------------------------|---------------------------------------------------|---------------------------------------------|
| 600M                          | 86%                     | 90%                                               | 50%                                         |
| agriculture-dependent Indians | are smallholder farmers | of farmers say usable forecasts improved planting | of cultivated land is rain-fed, no fallback |

</div> <br>

<br>

The Problem

Despite improving forecast accuracy, no widely deployed tool actually translates a weather forecast into a specific, same-day farm decision.

Farmers either don't receive forecasts in a usable form, or receive raw meteorological data — "60% chance of rain" — that they aren't equipped to turn into an irrigate, spray, or harvest decision on their own. **The interpretation gap, not the data itself, is where the value is lost.**

<br>

## 💡 The Solution

Kisan Saathi answers the exact question a farmer asks — *should I irrigate today, should I spray before the rain, should I delay harvest* — as a plain YES / NO / WAIT verdict, personalized to the farmer's crop and growth stage, backed by a one-line reason they can verify against their own field.

<div align="center">

| Instead of...                       | Kisan Saathi shows...                              |
|-------------------------------------|----------------------------------------------------|
| "60% chance of rain, 12mm expected" | 🚫 Skip irrigating today — rain expected in 18 hrs  |
| "Wind 14 km/h, humidity 78%"        | ✅ Spray now — dry window before tomorrow's rain    |
| Raw 7-day temperature grid          | ⌚ Wait 2 days to harvest — grain moisture too high |

</div> <br>

## 🌟 Key Features

- ✅ **Plain verdicts, not probabilities** — every decision leads with a yes/no/wait icon, never a raw percentage
- 🌱 **Crop-stage aware** — the same forecast means something different at sowing vs. flowering vs. harvest
- ⚠️ **Severe-weather priority alerts** — visually reserved red, never used for routine advisories
- 🔄 **Trust feedback loop** — one-tap "was this right?" turns a one-way broadcast into a system that earns trust
- 📊 **Visible track record** — season accuracy score, because farmers stop trusting a source after one unexplained miss

<br>

 **Screens**

<div align="center">

| # | Screen              | Purpose                                              |
|---|---------------------|------------------------------------------------------|
| 1 | Onboarding          | Crop, sowing date, farm setup                        |
| 2 | Home                | Today's decision cards + active severe-weather alert |
| 3 | Decision Detail     | Verdict, plain-language reasoning, feedback loop     |
| 4 | Severe Alert Detail | Protective action for the current crop stage         |
| 5 | Alerts List         | Active + historical severe-weather warnings          |
| 6 | 7-Day Forecast      | Icon-first day strip                                 |
| 7 | My Farm             | Crop, sowing date, stage, location, water source     |
| 8 | Track Record        | Season accuracy score, verdict history               |

</div> <br>

 **Design System**

<div align="center">

</div>

| Token     | Hex                                                                                       | Usage                              |
|-----------|-------------------------------------------------------------------------------------------|------------------------------------|
| Sky       |  #3E6D9C | Weather elements, primary chrome   |
| Soil      |  #6B4A2F | Crop and field-related content     |
| Go-Green  |  #3B7A4A | "Do it today" verdicts             |
| Amber     |  #B4691F | "Wait" verdicts                    |
| Alert Red |  #B23A2E | Severe-weather banners <i>only</i> |

**Typography** —  for headlines ·  for body/UI ·  for numbers and data

**Core principle:** the farmer should never have to interpret a raw probability. Every screen leads with a plain verdict icon; forecast detail is available only on request.

 **Try It**

No build step, no dependencies, no install — just open it in a browser.

```
bash
```

```
git clone https://github.com/your-username/kisan-saathi.git
cd kisan-saathi
open KisanSaathi_Prototype.html
```

Tap through the bottom tab bar and decision cards to walk the full flow: **Home → Decision Detail → Alerts → Forecast → My Farm → Track Record**

<br> <details> <summary><b>🔧 Built with</b></summary> <br>

Pure HTML, CSS, and vanilla JavaScript — no frameworks, no build tools, no dependencies. Fonts loaded from Google Fonts (Fraunces, Inter, Space Mono). Designed to be portable enough to open directly in a browser or import into Figma via HTML-to-design conversion.

</details> <br>

## Design Process

<div align="center">

**Discover → Define → Ideate → Design → Prototype & Test**

</div>

Built following a full 5-phase Human-Centered Design process. Every phase — background research, user persona, empathy map, journey map, HMW statements, Crazy 8 / SCAMPER ideation, information architecture, and a usability test plan — is documented in the case study [.docx](#).

<br>

## Roadmap

Scoped out during ideation but deliberately parked for a focused MVP:

- ☐ SMS/voice fallback for feature-phone households in low-connectivity areas
- ☐ Community-verified "it rained here" reports layered on the official forecast
- ☐ Full farm-management suite — expense tracking, yield logging
- ☐ Integration with e-NAM for a combined weather + market-price advisory
